Task 1: Error Handling Basics

Write a function that:

- Takes two numbers
- Divides them
- Handles division by zero using try...catch

Bonus: Display different messages based on the error type

Task 2: Custom Error

Create a function that:

- Accepts age as input
- Throws an error if age < 18

Output:

- "Valid Age" or "Invalid Age"

Task 3: finally Usage

Write a program that:

- Tries to access a property from an object
- Always prints "Done" whether an error occurs or not

Use finally

Task 4: Factory Function

Create a factory function that returns a Student object:

- Properties:
    - name
    - age

- Method:
    - sayHello()
- ---

Task 5: Constructor Function

- Rebuild Task 4 using a constructor function:

Task 6: Object Methods

Create an object that:

- Contains an array of numbers
- Has methods to:
    - Calculate the sum
    - Calculate the average

Task 7: Data Descriptor

Create an object with a property id:

- Make it:
    - Read-only
    - Not enumerable

Use:

Object.defineProperty()

Task 8: Accessor Descriptor

Create an object with:

- firstName
- lastName

Add a property fullName:

- get → returns full name
- set → splits and assigns values

Task 9: IIFE Pattern

Write a program using **IIFE** that:

- Creates a private variable counter initialized to 0
- Returns an object with:
  - increment() → increases counter by 1
  - getValue() → returns current counter value

Task 10: Closure

Create a Private Counter

Create a function createCounter that:

- Returns another function
- Each time you call it → it increments and returns a counter value

---

Task 11: BOM - Timer

Create a program that:

- Counts from 1 to 10
- Prints a number every second

👉 Use:

- setInterval
- Stop it at 10

Task 13: Window Timers

Create:

- setTimeout → prints after 3 seconds
- setInterval → prints every second

Stop interval after 5 times

Task 14: Digital Clock

Display:

- Current time updated every second

Format: HH:MM:SS
